Research focus - Heliosphere

- Development of novel models for the forecasting (& nowcasting) of Solar Energetic Particles (SEPs)
 - *For the first time* novel *Bayesian Probabilistic models* for **SEP prognosis** (PROSPER) were implemented
 - Improved forecasting concept for SEP forecasting (ML, AI, PCA)
 - Validation of the models and concepts (NASA/CCMC collaboration)

Research focus – Solar Orbiter Mission

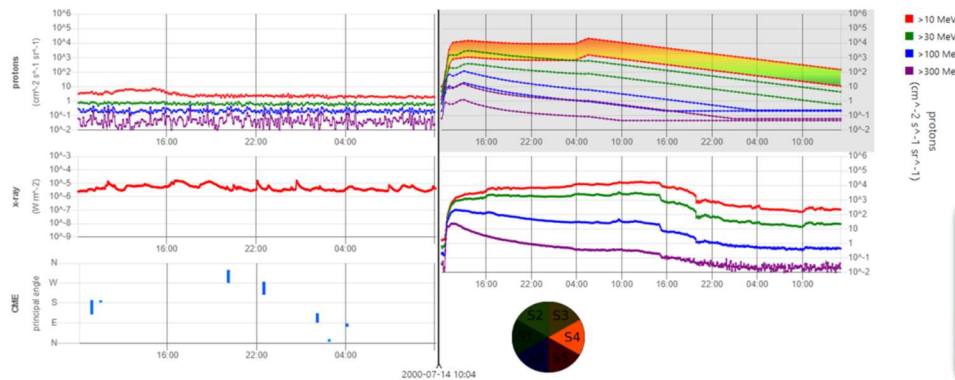

MADAWG Team

The primary goal of the Solar Orbiter mission is to address big questions in Solar System science to help us understand how the Sun creates and controls the heliosphere, surrounding the Solar System and influencing the planets within it. Our team is:

- Involved in the development and operation of a specialized module for the prognosis of the space weather conditions within the MADAWG Team

The ESA/NASA Solar Orbiter Mission:
Launched on February 07, 2020

Abstract

A consistent approach for the inherently imbalanced problem of solar energetic particle (SEP) events binary prediction is being presented. This is based on solar flare and coronal mass ejection (CME) data and combinations of both thereof. We exploit several machine learning (ML) and conventional statistics techniques to predict SEPs. The methods used are logistic regression (LR), support vector machines (SVM), neural networks (NN) in the fully connected multi-layer perceptron (MLP) implementation, random forests (RF), decision trees (DTs), extremely randomized trees (XT) and extreme gradient boosting (XGB). We provide an assessment of the methods employed and conclude that RF could be the prediction technique of choice for an optimal sample comprised by both flares and CMEs. The best-performing method gives a Probability of Detection (POD) of $0.76(\pm 0.06)$, False Alarm Rate (FAR) of $0.34(\pm 0.10)$, true skill statistic (TSS) $0.75(\pm 0.05)$, and Heidke skill score (HSS) $0.69(\pm 0.04)$. We further show that the most important features for the identification of SEPs, in our sample, are the CME speed, width and flare soft X-ray (SXR) fluence.

Review and assessment of the necessary **future steps** in *SEP prediction*, in view of manned missions

Services

Solar eruptive events nowcast and forecast

- **The Forecasting Solar Particle Events and Flares (FORSPEF) tool**

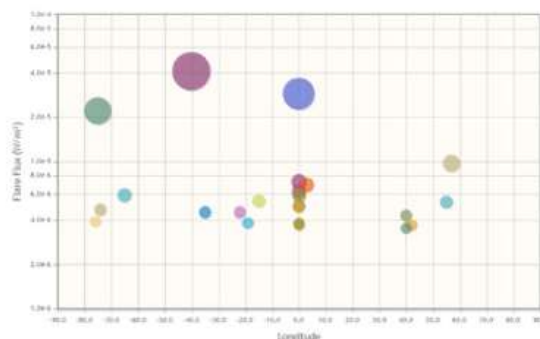

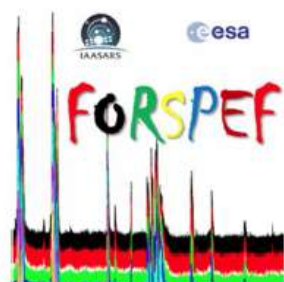

Availability **24/7** - **Open access**

Predictions on the SEP Occurrence and the Peak Proton Fluxes are available in real time

Predictions of the solar flare occurrence in real time for a time window of 24hours

Archived predictions are accessible through the web interface

> Web-based tool that provides *forecasting* of solar eruptive events, such as solar flares with a projection to coronal mass ejections (CMEs) (occurrence and velocity) and the likelihood of occurrence of a solar energetic proton (SEP) event. The tool also provides *nowcasting* of SEP events based on actual solar flare and CME near real-time alerts, as well as SEP characteristics (peak flux, fluence, rise time, duration) per parent solar event.
